INSTRUCTIONS

- Use Font size 22 to 28 and Font Style Times New Roman (body)
- Do not change the Template: Heading / Title of the slides
- Do not change font style or colours
- Do not copy paste paragraphs: use only Bullet Points
- Maximum slide Limit is 20 only
- As per the number of supervisor allotted adopt slide-2 or slide-3
- Please display the required meaningful Content or images or tables
- Change the footer accordingly using insert tab then click on header & footer tab and edit it
- Save the PPT with Register No, Dept and Review no, example: 23xxxxxxxxx_CSE

Title: Digital Healthcare Appointment Management Portal

Abstract

- The Digital Healthcare Appointment Management Portal is a web-based application developed using HTML, CSS, and JavaScript.
- The system allows users to register and log in to access healthcare appointment services through a simple and user-friendly interface.
- Patients can book medical appointments by selecting doctor specialization, appointment date, and available time slots.
- After booking an appointment, the system generates a consultation bill and allows users to complete the payment process.
- Once payment is completed, the appointment is confirmed and the details are stored for future reference.
- Users can track their appointment history through the track visits section, where the status of appointments such as booked, paid, or cancelled can be viewed.
- The portal also provides the option to cancel appointments if required, helping users manage their schedules effectively.

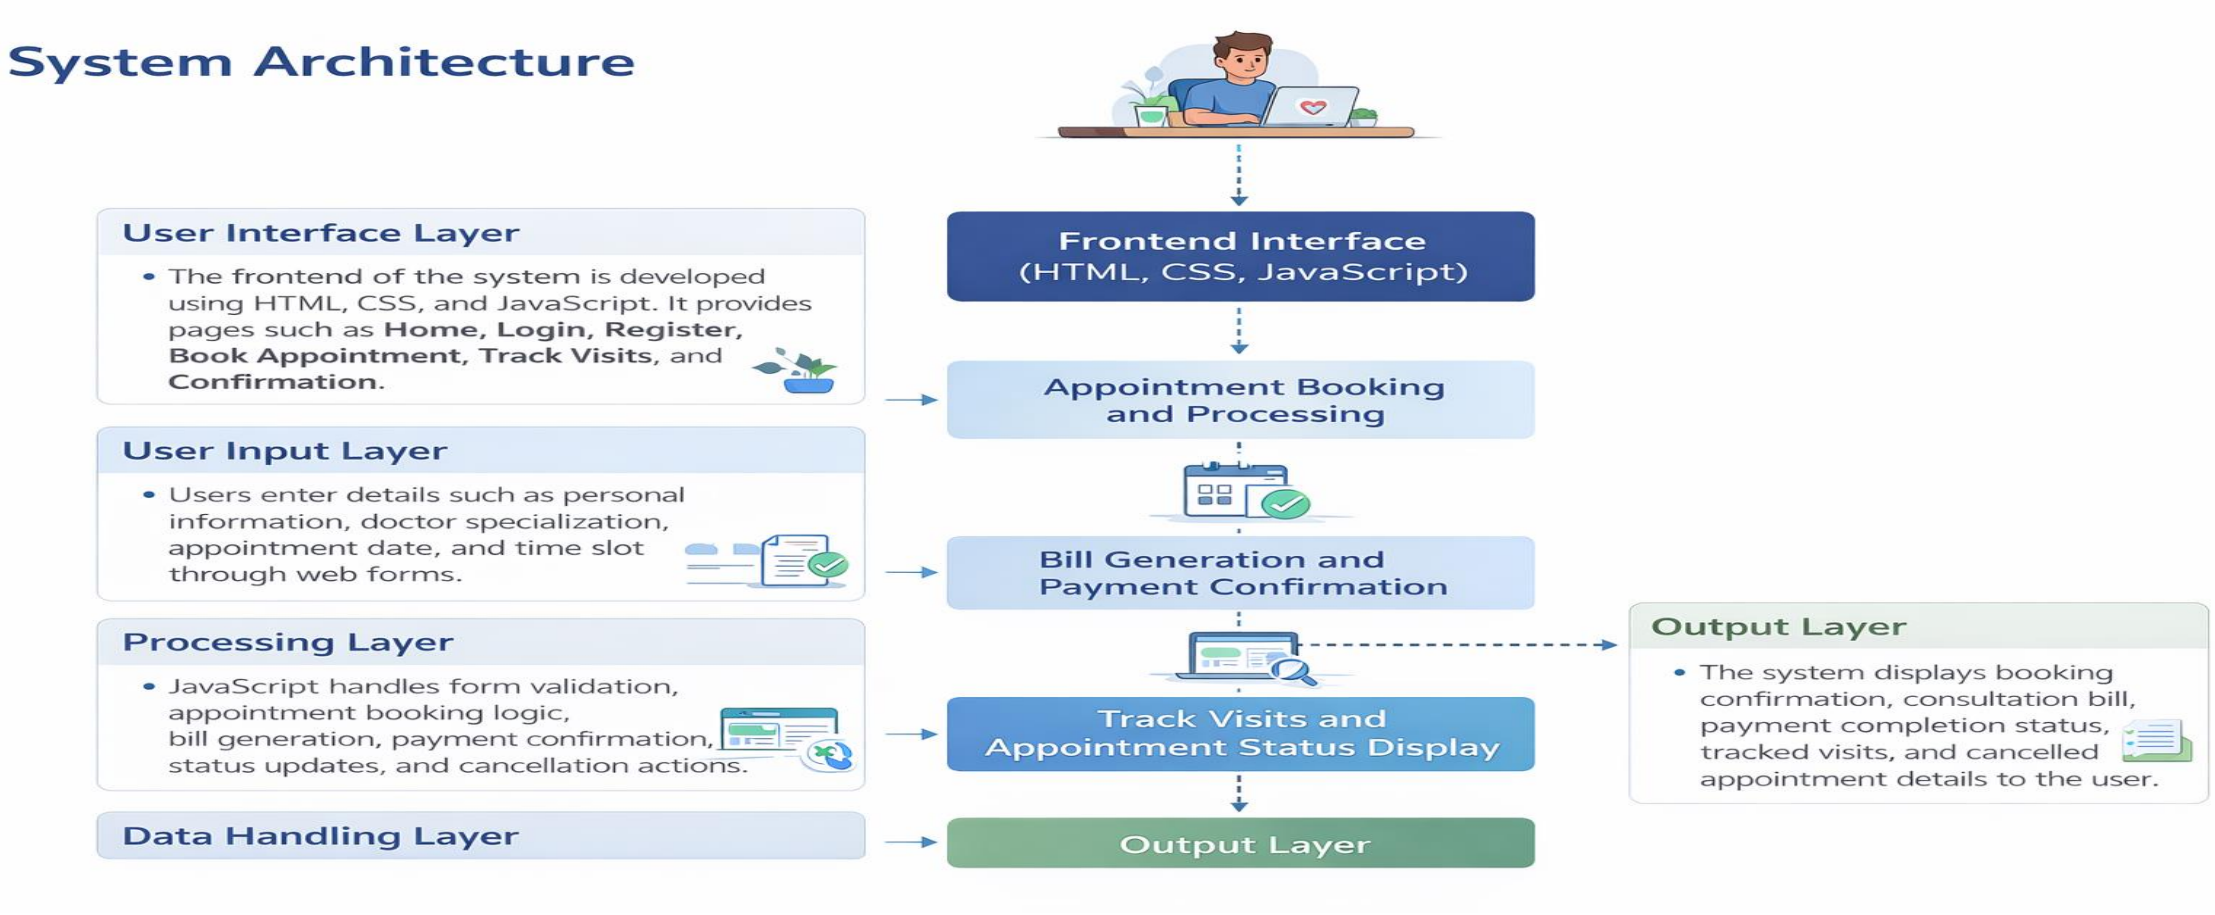
Existing System

- Patients usually book medical appointments by visiting the hospital directly or by calling the hospital reception.
- Appointment details are often recorded manually or through basic systems that are not easily accessible to patients.
- Patients may have to wait in long queues at the hospital to schedule consultations.
- Tracking previous visits or appointment history is difficult for patients because the information is not available online.
- Cancelling or rescheduling appointments can also be inconvenient since it usually requires contacting the hospital again.
- These methods can be time-consuming and less efficient for both patients and hospital staff.

Proposed System

- The proposed system is a web-based Digital Healthcare Appointment Management Portal developed using HTML, CSS, and JavaScript.
- It allows users to register, log in, book medical appointments, and manage their consultation details online.
- Patients can select doctor specialization, choose available dates and time slots, and book appointments easily through a user-friendly interface.
- The system generates a consultation bill after appointment booking and allows payment confirmation within the portal.
- The portal also provides an option to cancel appointments, making appointment management more flexible and convenient.
- The proposed system reduces manual effort, saves time, and improves accessibility by providing an organized online healthcare appointment service.

System Architecture



Project Modules

- **Home Module** – Displays the main dashboard of the portal and provides navigation to login, registration, and appointment services.
- **User Registration Module** – Allows new users to create an account by entering personal details such as name, email, and password.
- **Login Module** – Authenticates registered users and provides secure access to the healthcare appointment system.
- **Appointment Booking Module** – Enables patients to select a doctor, choose a date and time slot, and book a medical appointment.
- **Billing Module** – Generates a consultation bill after an appointment is booked and displays the payment amount.
- **Payment Module** – Allows users to complete payment and updates the appointment status from pending to paid.
- **Track Visits Module** – Displays the patient's appointment history and allows users to view previous and upcoming visits.
- **Appointment Management Module** – Allows users to cancel appointments and manage their booked schedules easily.

Objectives

- To develop a web-based system that allows patients to easily book medical appointments online.
- To provide a simple and user-friendly interface for patients to register, log in, and manage their appointments.
- To reduce the time and effort required for manual appointment scheduling in hospitals or clinics.
- To allow users to view available doctors, select suitable dates, and book appointments conveniently.
- To maintain patient and appointment information in an organized digital format.
- To provide features such as appointment confirmation, billing details, and payment options.

Co’s Attainments - DSA

CO1

- Searching algorithms used to check or retrieve appointment records (Linear Search / Binary Search concept)
- Sorting appointments based on date or time slots (Sorting algorithms concept)
- Understanding algorithm efficiency and performance using basic asymptotic concepts

CO2

- Arrays used to store appointment details or patient records
- Linked list concept for maintaining dynamic appointment entries
- Operations like insertion (new appointment), deletion (cancel appointment), and traversal (view appointments)

CO3

- Queue concept for managing appointment requests in order
- Priority Queue idea for giving priority to urgent patients
- Queue operations like enqueue (add appointment) and dequeue (process appointment)

CO4

- Hashing concept for fast lookup of patient or appointment details
- Hash table concept for storing user login or appointment data
- Map structures (key-value pairs) for storing patient ID and appointment information

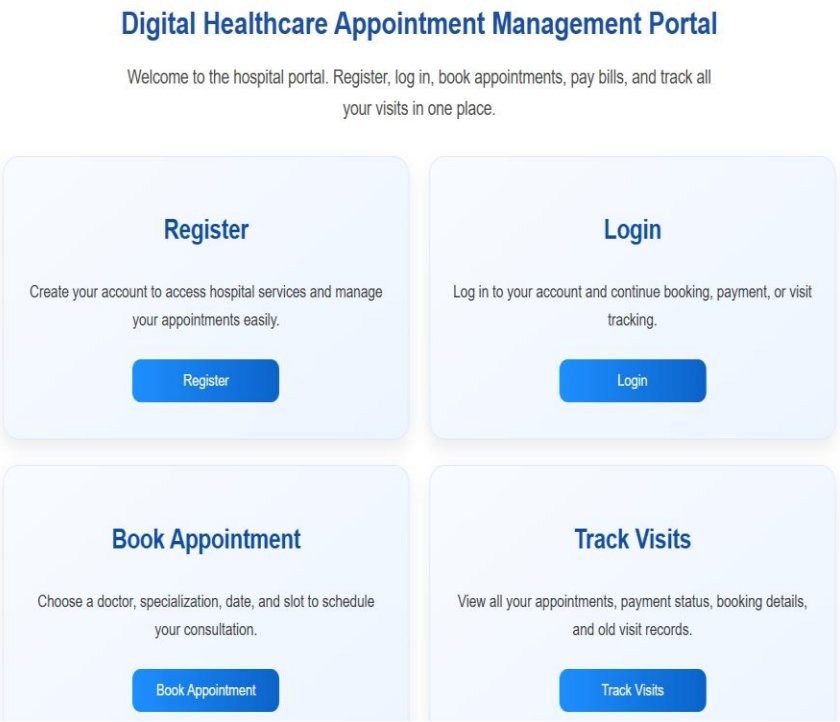
CO5

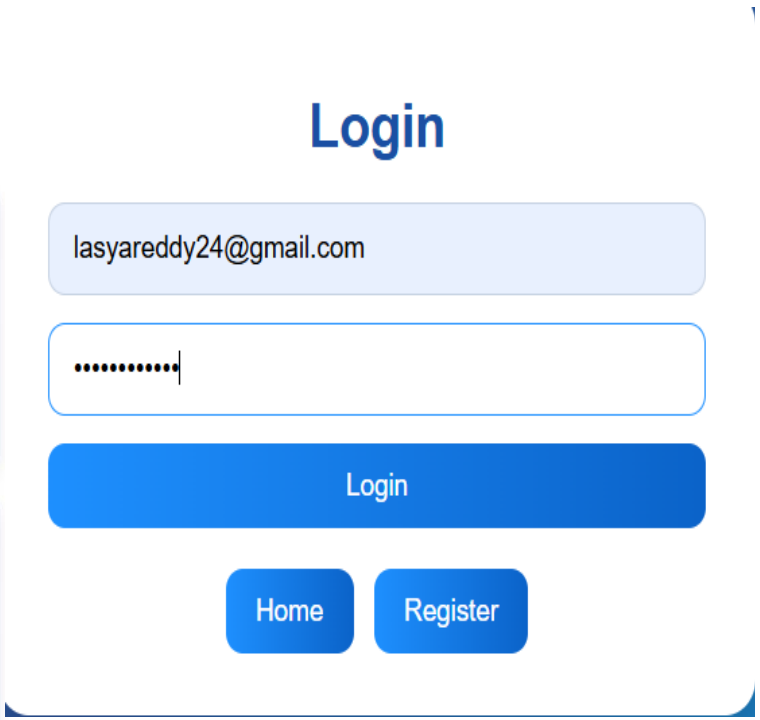
- Queue concepts applied in appointment booking workflow
- List structures used for tracking visit history and appointment records
- Efficient data organization for managing healthcare scheduling

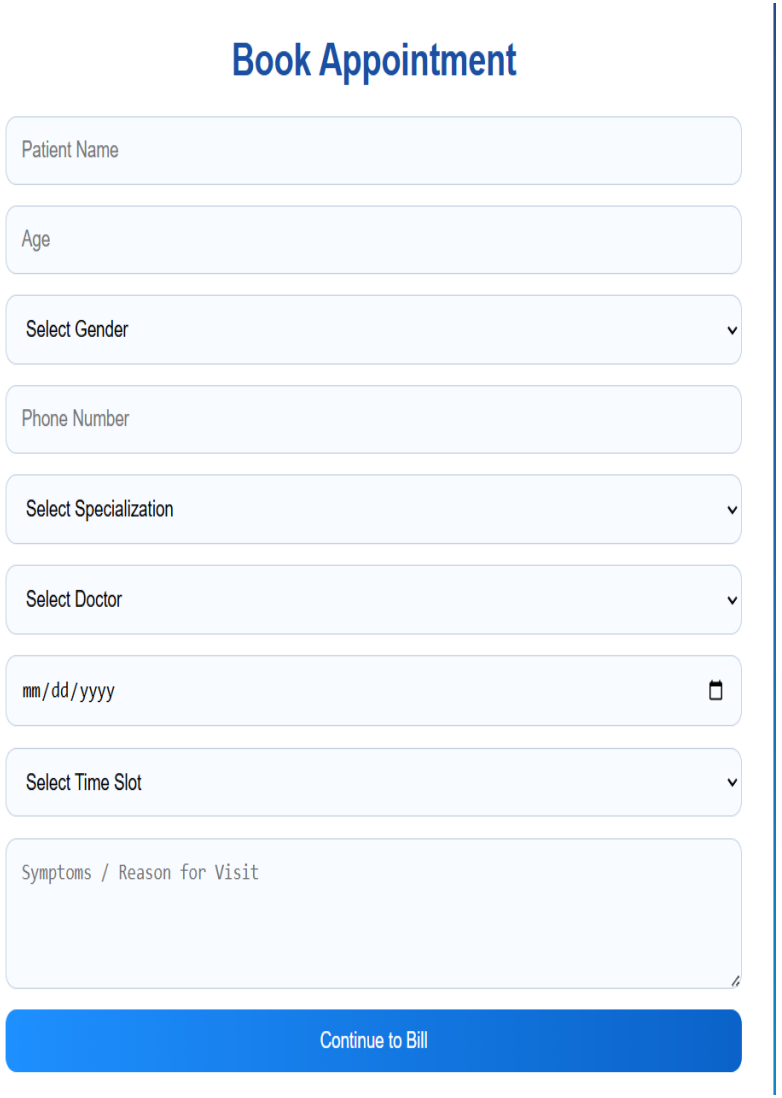
CO6

- Integration of data structures into a real-world healthcare management system
- Applying DSA concepts to handle booking, cancellation, and tracking of appointments
- Developing a functional application that demonstrates practical use of data structures

Screenshots for FWD







Screenshots for DSA

```
=== Digital Healthcare Appointment Management Portal ===
1. Book Appointment
2. Display All Appointments
3. Search Appointment (Linear Search)
4. Search Appointment (HashMap)
5. Sort Appointments by ID
6. Search Appointment (Binary Search)
7. Cancel Appointment
8. Process Next Appointment (Queue)
9. Process Priority Appointment (Priority Queue)
10. Update Payment Status
11. Exit
```

```
Enter your choice: 1
Enter Appointment ID: 12921
Enter Patient Name: John
Enter Doctor Name: Liam
Enter Date (dd-mm-yyyy): 12-03-26
Enter Time: 12:00pm
Enter Payment Status (Pending/Paid): Paid
Enter Priority (1 = Emergency, 2 = Normal, 3 = Low): 1
Appointment booked successfully.
```

Conclusion

- The Digital Healthcare Appointment Management Portal provides an efficient platform for patients to book and manage medical appointments online.
- The system simplifies the appointment scheduling process and reduces the need for manual booking at hospitals or clinics.
- The project demonstrates the practical use of HTML, CSS, and JavaScript in developing an interactive web application.
- Deploying the project using GitHub and GitHub Pages shows how web applications can be managed and hosted online.
- Overall, the project improves convenience, accessibility, and efficiency in managing healthcare appointments.
